

FytoSol, a new COS-OGA derivative to fight potato late blight

fytoSol

Ir Géraldine van Aubel, *PhD*
Research Manager – FytoFend

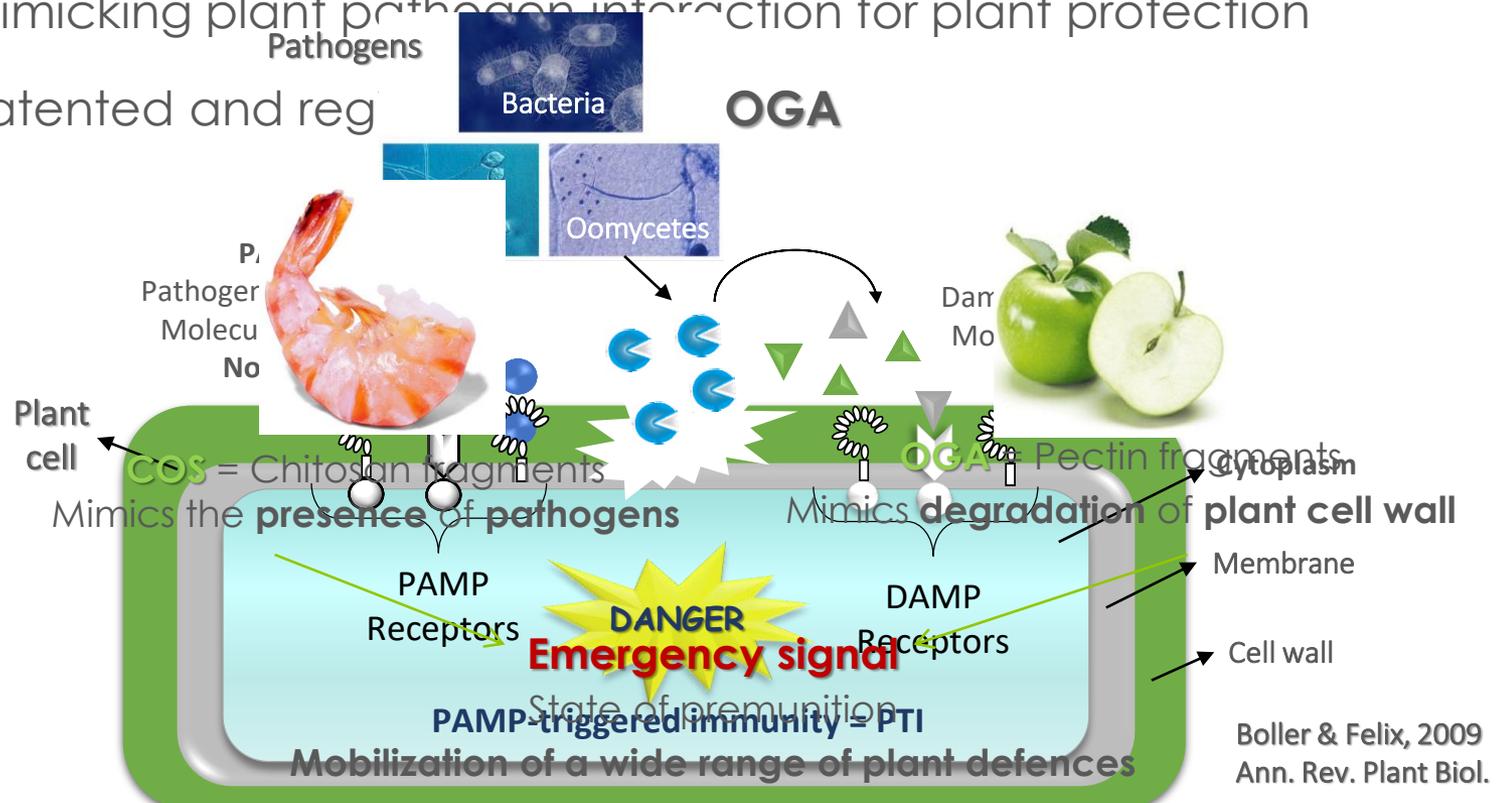

23 October 2018, Basel, Switzerland

fytoFend
Pioneering Biological Alternatives

FytoFend, an innovative company

- Belgian company
- Oligosaccharides production → PTI stimulation
- Mimicking plant pathogen interaction for plant protection
- Patented and registered

FytoSol, a new COS-OGA derivative
to fight potato late blight

Bringing COS-OGA to the next level

- FytoSave: 12,5 g/L COS-OGA
- Effective against PM and DM on grapes, vegetables, apple scab, rice blast

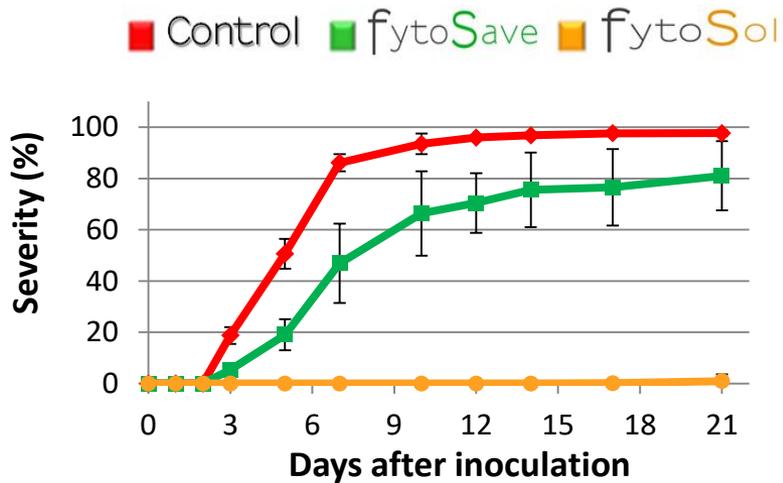

- Polycyclic disease requiring 15 sprayings/year
- More aggressive strains

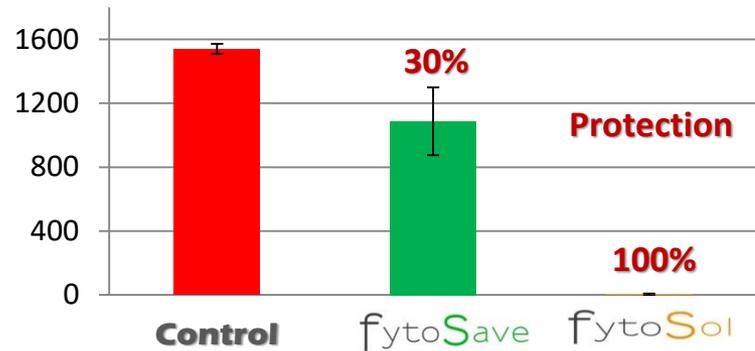

fytoSol
New !!!
12,5 g/L COS-OGA

FytoSol against potato late blight

AUDPC

Control

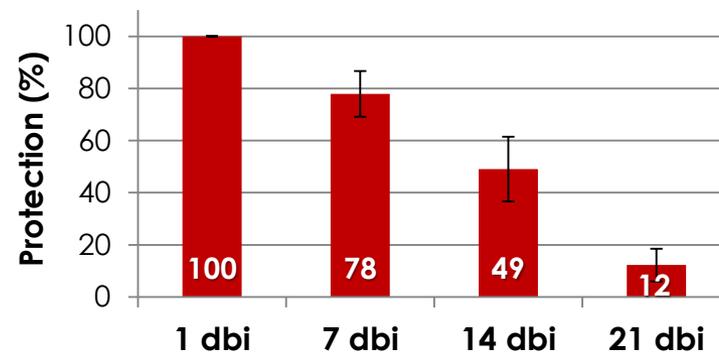

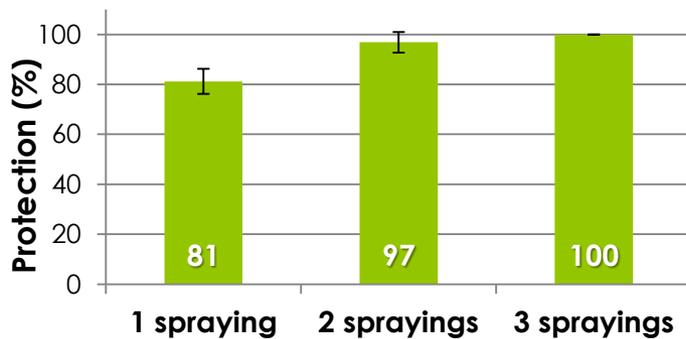

fytoSave

fytoSol

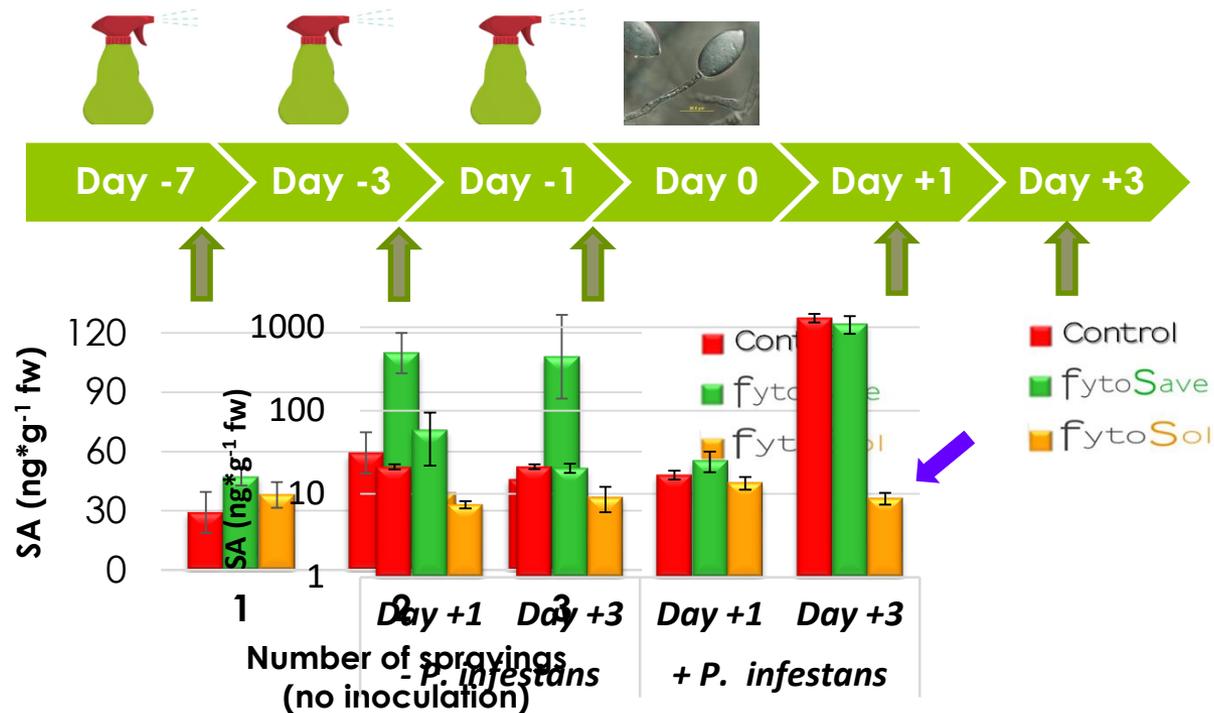

FytoSol: How to use?

- Timed application procedure?
- Cumulative effect: 1, 2 or 3 sprayings before *P. infestans*
- Persistence: 1, 7, 14 or 21 days before infection (dbi) with *P. infestans*

FytoSol: Mode of action

- SA quantification 1 day after each sprayings or 1 and 3 after *Pi*

- SA accumulation for FytoSave but not for FytoSol!
- P. infestans* induced SA accumulation except in FytoSol-treated plants

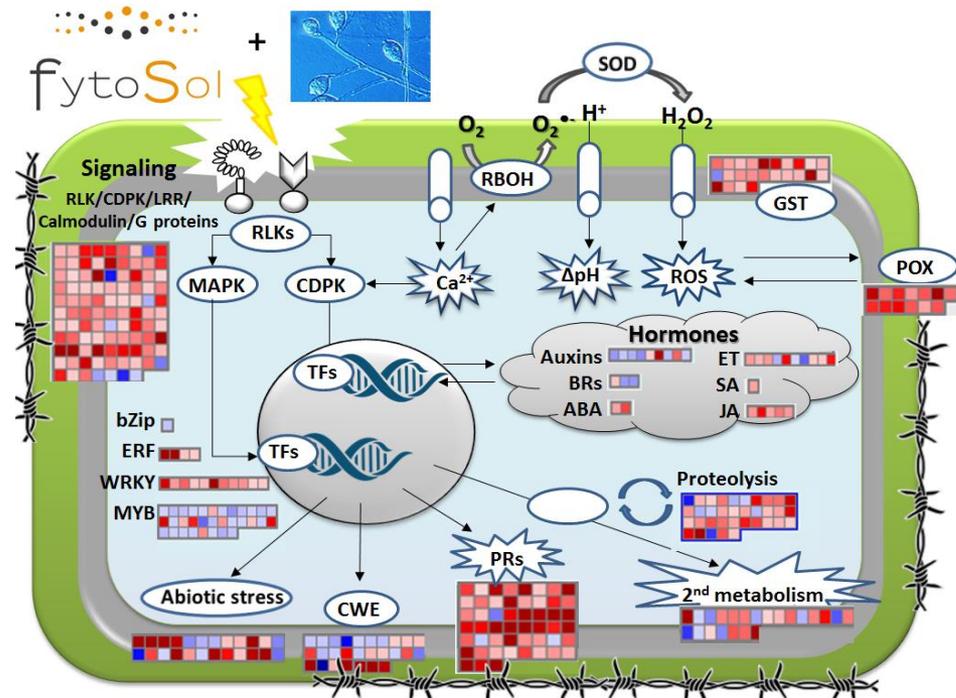

FytoSol: Mode of action

- Potato plants sprayed 3 times with FytoSol 0,5% or water
- Leaves harvest 24h after infection with *P. infestans* at $1.5 \cdot 10^4$ sporangia/ml
- RnaSeq and MapMan of mRNA involved in biotic stress

Effect of FytoSol
on infected plants:

→ Massive upregulation of
biotic stress responses!

Conclusions / perspectives

- Preventive and repeated applications crucial for efficacy
- FytoSol blocks SA hijacking by *P. infestans*
- FytoSol induces massive upregulation of biotic stress responses
- Promising results → Field trials
- **FytoSol to be integrated in a program**
 - Repeated sprayings over the whole season
 - Combining with DSS
 - Reduced fungicide doses → IPM
 - Reduced copper doses → OF

*FytoSol, a new COS-OGA derivative
to fight potato late blight*
